Just Accepted

"Just Accepted" manuscripts have been peer-reviewed and accepted for publication. They are posted online prior to technical editing, formatting for publication and author proofing. The American Chemical Society provides "Just Accepted" as a free service to the research community to expedite the dissemination of scientific material as soon as possible after acceptance. "Just Accepted" manuscripts appear in full in PDF format accompanied by an HTML abstract. "Just Accepted" manuscripts have been fully peer reviewed, but should not be considered the official version of record. They are accessible to all readers and citable by the Digital Object Identifier (DOI®). "Just Accepted" is an optional service offered to authors. Therefore, the "Just Accepted" Web site may not include all articles that will be published in the journal. After a manuscript is technically edited and formatted, it will be removed from the "Just Accepted" Web site and published as an ASAP article. Note that technical editing may introduce minor changes to the manuscript text and/or graphics which could affect content, and all legal disclaimers and ethical guidelines that apply to the journal pertain. ACS cannot be held responsible for errors or consequences arising from the use of information contained in these "Just Accepted" manuscripts.

KEYWORDS: [6+2]-Cycloaddition; Cobalt; 1,3,5,7-Cyclooctatetraene; Bicyclo[4.3.1]decane; Bicyclo[4.2.2]decane.

Abstract: A new, effective catalytic system based on $Co(acac)_2$ has been developed for [6+2]cycloaddition of terminal alkynes to 1,3,5,7-cyclooctatetraene to give substituted

bicyclo[4.2.2]deca-2,4,7,9-tetraenes in high yields (68-85%). The electrophilic activation of double bonds in the bicyclic products with m-CPBA is an efficient method for the synthesis of substituted bicyclo[4.3.1]deca-2,4,8-triene-7,10-diols, which form the key structural moiety of numerous natural biologically active compounds. The structures of the obtained compounds were reliably proven by modern spectral methods and X-ray diffraction. The mechanism of the discovered rearrangement was studied both using deuterium-labeled bicyclo[4.2.2]deca-2,4,7,9quantum chemical tetraenes and utilizing calculations. The obtained substituted bicyclo[4.3.1]deca-2,4,8-triene-7,10-diols and their keto derivatives showed high antitumor activity in vitro against Hek293, Jurkat, K562 and A549 tumor cell lines.

INTRODUCTION

The bicyclo[4.3.1]decane core is the key structural unit of many natural biologically active compounds, such as, caryolane, phomoidride B, vibsanines, welwitindolinones, nakafuran-9, pallescensins C and D, florlides and so on (Figure 1),¹ which exhibit anti-HIV, antitumor, antimicrobial, antibacterial, and antimicotic properties.^{1f,2} These compounds contain diverse functional groups and numerous asymmetric centers, the choice of a strategy for forming the bicyclo[4.3.1]decane core, which would determine the sequence of transformations to prepare the desired compound, is a key problem of planning their total syntheses. Evidently, with more extensive range of preparation methods for these bicyclic products being at the disposal of a synthetic chemist, the final goal will be achieved more efficiently. The most popular methods for the formation of bicyclo[4.3.1]decanes are based on metathesis, intramolecular Diels-Alder reaction, Pd-catalyzed [6+3]-cycloaddition of trimethylenemethane to tropones, and Cucatalyzed [3+3]-cycloaddition of propargyl esters to cyclic enamines.^{1a,3}

Page 3 of 32

Figure 1. Some natural biologically active compounds containing the bicyclo[4.3.1]decane core.

We found a single example of the synthesis of bicyclo[4.3.1]deca-2,4,8-trienes (Scheme 1)⁴ and no examples of their rearrangement to bicyclo[4.2.2]deca-2,4,7,9-tetraenes involving substituted substrates.

No data on the possibility to extend this rearrangement to substituted bicyclo[4.2.2]deca-2,4,7,9tetraenes were reported in the literature before our study.

This reaction has significant synthetic potential, because the preparation of bicyclo[4.3.1]decanes with various substituents is accompanied by simultaneous introduction of reactive functional groups into the molecules, which allows for further targeted transformations into useful compounds with specific properties.

Substituted bicyclo[4.2.2]deca-2,4,7,9-tetraenes are accessible compounds owing to the lately developed Co-catalyzed [6+2]-cycloaddition reactions of alkynes with 1,3,5,7-cyclooctatetraene (COT) (Scheme 1).⁵

Scheme 1. Schematic view of the goals of our investigation in comparison with known published data.

The key goals of this investigation (Scheme 1) are the: development of an efficient and selective catalyst for [6+2]-cycloaddition of alkynes to 1,3,5,7-cyclooctatetraene, the use of substituted bicyclo[4.2.2]deca-2,4,7,9-tetraenes in the synthesis of bicyclo[4.3.1]decanes and an evaluation of the antitumor activity *in vitro* of these products.

RESULTS AND DISCUSSION

Development of a Catalytic System for [6+2]-cycloaddition Reaction of Alkynes with COT.

The development of an efficient method for the synthesis of bicyclo[4.3.1]decanes required a convenient method for the synthesis of potential precursors, namely, bicyclo[4.2.2]deca-2,4,7,9-tetraenes (Scheme 1). Among the currently known methods for the synthesis of bicyclo[4.2.2]deca-2,4,7,9-tetraenes, the method of Buono et al.,⁵ based on [6+2]-cycloaddition

of alkynes to COT catalyzed by three- or four-component $CoI_2(dppe)/Zn/ZnI_2$ ($CoI_2/dppe/Zn/ZnI_2$) systems (Scheme 1), seemed most appropriate the preparation of key bicyclic compounds in gram amounts. A considerable drawback of this method is the necessity to use expensive diiodo(bis-(diphenylphosphino)ethane)cobalt(II) or highly hygroscopic cobalt(II) iodide. We attempted to develop a new catalytic system with replacement of CoI_2 by more readily accessible and stable Co compounds, for example, $Co(acac)_2$, $Co(acac)_3$, $CoCI_2$, $CoBr_2$, or $Co(OAc)_2$, and with the use of new activating ligands and reducing agents (Table 1).

^{*a*} Reaction conditions: COT $1/C_8H_6$ **2a**/catalyst/ligand/reducing agent/Lewis acid = 1.2/1/0.1/0.1/0.3/0.2, $C_2H_4Cl_2$, 60 °C, 20 h.

^b Yields of isolated products by column chromatography.

We found that CoI_2 can be successfully replaced by $Co(acac)_2$, $Co(acac)_3$, or $Co(OAc)_2$. With $Co(acac)_2$ as the catalyst, the yield of 7-phenylbicyclo[4.2.2]deca-2,4,7,9-tetraene (**3a**) was ~75%. The use of $Co(acac)_2$ is preferred, because its cost is two orders of magnitude lower than the cost of cobalt(II) iodide.⁶

Furthermore, after being stored in air for 1 week $Co(acac)_2$, did not lose activity unlike CoI_2 , was deliquescent and became unusable within several hours under similar conditions. The

replacement of Zn by Mg or In has virtually no influence on the yield of the target bicyclic product **3a** (Table 1). It was found that dichloroethane can be replaced by an aromatic (benzene, toluene) or aliphatic solvent (hexane, heptane, octane).

The cycloaddition of various substituted alkynes **2** to COT **1** was conducted in the presence of the modified $Co(acac)_2/dppe/Zn/ZnI_2$ catalytic system to give the target bicyclo[4.2.2]deca-2,4,7,9-tetraenes **3** in 68-85% yields (Table 2).

Isomerization of Bicyclo[4.2.2]deca-2,4,7,9-tetraenes 3 into Bicyclo[4.3.1]deca-2,4,8-triene-7,10-diols 5,6 Induced by m-CPBA.

In the next stage of our research, we attempted to perform skeletal isomerization of the prepared bicyclo[4.2.2]deca-2,4,7,9-tetraenes via electrophilic double bond activation by treatment with molecular Br_2 to give the target 7,10-dibromobicyclo[4.3.1]deca-2,4,8- trienes.

The reaction of 7-phenylbicyclo[4.2.2]deca-2,4,7,9-tetraene (**3a**) with Br₂ under the chosen conditions (**3a**/Br₂ = 1/1, CHCl₃, - 75 °C) served as the model reaction (Scheme 2).

Scheme 2. Reaction of 7-phenylbicyclo[4.2.2]deca-2,4,7,9-tetraene (3a) with Br₂

Instead of the expected 7,10-dibromobicyclo[4.3.1]deca-2,4,8-trienes, the reaction selectively affords 9,10-dibromo-7-phenylbicyclo[4.2.2]deca-2,4,7-triene (4) (70% yield), resulting from the addition of bromine to the C(9)-C(10) double bond of adduct **3a**.

Having failed to perform skeletal isomerization of substituted bicyclo[4.2.2]deca-2,4,7,9tetraenes by means of Br₂, which is a weak electrophile, we suggested that m-chloroperbenzoic acid, a conventional electrophilic reagent, would be suitable for this goal. When

 bicyclo[4.2.2]deca-2,4,7,9-tetraenes **3a-e** were made to react with m-CPBA in 1:1.4 ratio under the chosen conditions (CH₂Cl₂, 0 $^{\circ}$ C (3 h), 25 $^{\circ}$ C (12 h)), the target bicyclo[4.3.1]deca-2,4,8triene-7,10-diols **5**, **6**, rather than the expected oxiranes, were formed in more than 80% yields as mixtures of two regioisomers (Table 3). Each isomer was isolated in a pure state by column chromatography and their structures were proved by 1D and 2D NMR techniques.

Table 3. Reaction of Bicyclo[4.2.2]deca-2,4,7,9-tetraenes (3a-e) with m-CPBA^a

^{*a*} Reaction conditions: bicyclo[4.2.2]deca-2,4,7,9-tetraene 3/m-CPBA = 1/1.4, CH₂Cl₂, 0 °C (3h),

25 °C (12 h).

^b Ratio determined by ¹H NMR.

^c Yields of isolated products by column chromatography.

1-Phenylbicyclo[4.3.1]deca-2,4,8-triene-7,10-diol **5a** thus obtained was a crystalline solid and crystals were obtained that were suitable for X-ray diffraction. The X-ray diffraction data for **5a** unambiguously demonstrate that the hydroxyl group at the C(10) bridging carbon atom has an *anti*-orientation relative to the butadiene skeleton of the molecule and that the hydroxyl at C(7) has an *exo*-orientation relative to the bridging part of the molecule (Fig. 2).

Figure 2. Structure of compound 5a in the crystal (ellipsoid contour probability 50%).

In order to elucidate the stereochemical orientation of hydroxyl groups of other substituted examples of **5** (**5b-e**), 2D NMR experiments were conducted. The NOESY spectrum of 1butylbicyclo[4.3.1]deca-2,4,8-triene-7,10-diol **5b** exhibited intense cross-peaks between the proton signals of two hydroxyl groups and one β -methylene proton of the butyl group, as a result of polarization transfer in the three-proton system, which is indicative of spatial proximity of the protons at C(10)-OH, C(7)-OH, and C(11)-H_{β}. This configuration implies *anti*-orientation of the hydroxyl group at the C(10) bridging atom and *exo*-orientation at the C(7) atom. Similarly, according to the NOESY experiments, the second regioisomer, 6-butylbicyclo[4.3.1]deca-2,4,8-triene-7,10-diol **6b**, had *anti*- and *exo*-oriented hydroxyl groups.

In order to elucidate the mechanism of the skeletal isomerization of bicyclo[4.2.2]deca-2,4,7,9tetraenes into bicyclo[4.3.1]deca-2,4,8-trienes, we studied the reaction of monodeuterated 7phenylbicyclo[4.2.2]deca-2,4,7,9-tetraene 7 as a model compound with m-chloroperbenzoic acid under the developed optimal conditions (CH₂Cl₂, 0 °C (3 h), 25 °C (12 h)). Under the chosen conditions, the reaction gave monodeuterated 1-phenylbicyclo[4.3.1]deca-2,4,8-triene-7,10-diol

8 in 80% yield (Scheme 3). The carbon NMR spectrum of **8** indicates that the deuterium atom is found on the bridging C(10) carbon. Thus, it can be determined quite strictly which part of the carbon skeleton of the starting molecule **7** forms the bridging group in molecule **8**.

Scheme 3. Reaction of 7-phenyl-8-deuterobicyclo[4.2.2]-deca-2,4,7,9-tetraene (7) with m-CPBA

According to published data, the rate of alkene epoxidation with m-CPBA increases with increasing electron density at the double bond.⁷ The alkyl or aryl substituent in position 7 of bicyclo[4.2.2]deca-2,4,7,9-tetraene **A** increases the nucleophilicity of the substituted double bond and is favorable for selective epoxidation (Scheme 4). According to our experimental data, the reaction is stereoselective giving exclusively the *exo*-addition product **B**. The subsequent protonation of the oxygen atom by m-chlorobenzoic acid makes the oxirane more electrophilic. By calculation of the Fukui indices in the B3LYP/6-31G(d,p) basis set, we identified the preferred sites of nucleophilic and electrophilic attacks in molecule **C** (Table 4). According to this analysis, an intramolecular electrophilic attack may occur at C(2) and C(5) atoms. Calculation data also attest to the preferred intramolecular nucleophilic attack at C(7), C(2), and C(5) atoms. Thus, upon cleavage of the protonated oxirane ring, one can expect an intramolecular rearrangement to yield intermediate **D** (via nucleophilic attack of C(2) at C(7)). According to these calculations, the formation of intermediate **D** is more favorable. The difference between the free energies of formation of intermediates **D** and **E** is 14.2 kcal/mol. It is worth noting that we failed to locate, on the

potential energy surface, carbocation **F**, which could have resulted from cleavage of the protonated oxirane ring. The conversion of intermediate **C** to **D** occurs virtually without a barrier via a butterfly-like transition state **G**, the activation energy of the conversion being 0.1 kcal/mol. Intermediate **D** is a substituted bis-homotropylium cation, which is homoaromatic.⁸ Its formation was postulated previously for rearrangements of bicyclo[4.3.1]decatriene and its derivatives.^{4,9} According to the calculated Fukui indices, the preferred sites for nucleophilic attack in carbocation **D** are positions at C(7), C(9), C(3), and C(5). Addition of a nucleophile to positions at C(3) and C(5) is thermodynamically unfavorable, as this gives strained structures containing a cyclopropane moiety. An attack of a water molecule on positions at C(7) or C(9) yields dihydroxy derivative **H** or **I**, respectively. Despite the higher f(+) value of C(9) in intermediate **D**, a substituent at C(1) reduces the spatial accessibility of the electrophilic carbon atom. In the case of bulky phenyl substituent, the reaction involves only C(7) and gives compound **H**. However, the alkyl-substituted bis-homotropylium cation gives a mixture of C(7) (**H**)- and C(9) (**I**)-addition products in ~ 1:1 ratio, indicating that the energy barriers for the formation of these products are comparable.

Scheme 4. Putative mechanism for the transformation of substituted bicyclo[4.2.2]deca-2,4,7,9-tetraenes into substituted bicyclo[4.3.1]deca-2,4,8-triene-7,10-diols under the action of m-CPBA

Fairly interesting results were obtained upon the oxidation of COT adducts with alkynol. The reaction of **3h-j** with m-chloroperbenzoic acid is accompanied by intramolecular cyclization to give tricyclic alcohols **9** and **10** (Table 5).

Table 5. Reaction of 7-(ω-hydroxyalkyl)bicyclo-[4.2.2]deca-2,4,7,9-tetraenes (3h-j) with m-CPBA^a

^{*a*}Reaction conditions: bicyclo[4.2.2]deca-2,4,7,9-tetraene **3**/m-CPBA = 1/1.4, CHCl₃, 0 °C (3h), 40 °C (3 h), 25 °C (12 h).

^b Ratio determined by ¹H NMR.

^c Yields of isolated products by column chromatography.

The tricyclic compound **9i** was a crystalline solid and its structure was established by X-ray diffraction. The X-ray diffraction data unambiguously prove the *anti*-orientation of the hydroxyl group at the bridging carbon atom relative to the butadiene skeleton and the *exo*-orientation of the tetrahydropyran moiety relative to the bridging part of the molecule (Figure 3).

Figure 3. Structure of compound 9i in the crystal (ellipsoid contour probability 50%).

This reaction is a result of the fact that cation (Table 5) contains a hydroxyl group that can act as a nucleophile. As noted above, the reaction gives rise to a bis-homotropylium cation. Thus, the hydroxyl attacks the electrophilic site of the bis-homotropylium cation; this furnishes a five-, six-, or seven-membered ring. It is noteworthy that in the case of co-dimers **3h**,**i**, the hydroxyl group attacks only at C(9). Conversely, adduct **3j** containing a butanol substituent reacts not only at C(9) but also at C(7) to give tricyclic compounds **9j** and **10j** in 5:1 ratio. Apparently, in this case, the arrangement of the hydroxyl group relative to the C(7) electrophilic center is more favorable for nucleophilic attack than in the case of ethanol or propanol substituents.

It is necessary to mention that the hydroxyl groups present in the bicyclo[4.3.1]deca-2,4,8-triene-7,10-diol molecule are by themselves reaction sites bearing a huge potential for further transformations. For example, oxidation of the hydroxyl groups of bicyclo[4.3.1]deca-2,4,8triene-7,10-diols **5a,b,d,e**, and **6b,d** on treatment with Sarett reagent, a chromium oxide complex with pyridine, furnished bicyclo[4.3.1]deca-2,4,8-triene-7,10-diones **11a,b,d,e**, and **12b,d** in virtually quantitative yields (Scheme 5).

Scheme 5. Sarett oxidation of bicyclo[4.3.1]deca-2,4,8-triene-7,10-diols (5a,b,d,e, 6b,d)

The *in vitro* antitumor activities of bicyclo[4.3.1]deca-2,4,8-triene-7,10-diols (5a,b) and their keto derivatives (11a,b).

It is known from the literature that some structural derivatives of natural compounds are often much more active than the parent compounds. Therefore, investigation of the modified analogues of highly active natural products seems fairly promising. Considering the structural similarity of the prepared bicyclo[4.3.1]decanes with some natural compounds,¹ which exhibit a wide range of biological activities, it seemed of practical interest to assess the antitumor activity *in vitro* of some of the compounds that were synthesized.

The experimental results indicate that the Hek293, Jurkat, K562 and A549cell lines showed different degrees of sensitivity to the tested series of with bicycles **5a,b** and **11a,b**. The clear-cut

The Journal of Organic Chemistry

heterogeneity of the IC₅₀ values demonstrated for different tumor cell lines *in vitro* is a key factor indicative of a specific antitumor activity rather than non-specific toxicity, in which case the inhibitory concentration (IC₅₀) values obtained for different cell lines would be similar.¹⁰ The IC₅₀ for the tested compounds was in the range between 0.24±0.02 and 2.1±0.2 μ M. Compound **11a** was the most active inhibitor of the HEK293, Jurkat, A549 and K562 tumor cell growth, as it inhibited cell viability when present in lower concentrations (IC₅₀ of 0.24±0.02–0.58±0.05 μ M) than camptothecin (IC₅₀ of 25.17±0.9–82.9±1.3 μ M) or etoposide (IC₅₀ of 19.45±0.8–74.5±1.8 μ M). It was also demonstrated that its diol analog **5a** has a weaker cytotoxic activity towards HEK293, Jurkat, and K562 (IC₅₀ of 0.84±0.09–1.74±0.18 μ M). Weak antitumor activities *in vitro* were found for compounds **5b** and **11b**, the IC₅₀ values being (IC₅₀ of 1.12±0.11–2.1±0.2 μ M).

CONCLUSIONS

A new, effective catalytic system based on $Co(acac)_2$ has been developed for [6+2]cycloadditions of terminal alkynes to 1,3,5,7-cyclooctatetraene to give substituted bicyclo[4.2.2]deca-2,4,7,9-tetraenes in high yields (68-85%). Oxidation of bicyclo[4.2.2]deca-2,4,7,9-tetraenes with m-chloroperbenzoic acid resulted in the formation of bicyclo[4.3.1]deca-2,4,8-triene-7,10-diols in 78-82% yields. The proposed method for the synthesis of the bicyclo[4.3.1]decane system may serve as an alternative to the existing methods for the preparation of molecules of this type and could be used as the key steps in the synthesized compounds is being actively investigated and we hope that significant results will be achieved in the future in this area.

Experimental Section

General Information.

Chromatographic analysis was performed on a chromatograph using a 2000×2 mm column, the SE-30 (5 %) stationary phase on Chromaton N-AW-HMDS (0.125-0.160 mm), helium carrier gas (30 mL/min), temperature programming from 50 to 300 °C at a 8 °C/min rate. Flash column chromatography was performed over silica gel 0.060-0.200 mm, 60 A. The ¹H and ¹³C NMR spectra were recorded for CDCl₃ solutions on a 100 MHz for ¹³C and 400 MHz for ¹H, and 125 MHz for ¹³C and 500 MHz for ¹H spectrometers. The chemical shifts are reported as d values in parts per million relative to internal standard Me₄Si. The coupling constants (J) are reported in Hertz. X-Ray diffraction analysis was performed on an four-circle automated diffractometer (graphite monochromator, MoK α radiation, $\lambda = 0.71073$ Å, w-scan mode, $2\theta_{max} = 62^{\circ}$). The data were collected and treated by using the CrysAlis^{Pro} Oxford Diffraction Ltd. Program package, version 1.171.36.20. The structures were solved by the direct method and refined by the fullmatrix least-squares method in the anisotropic approximation for non-hydrogen atoms. The hydrogen atoms were located on electron density maps and refined in the isotropic approximation. The refinement was done using the SHELX97 program package.¹¹ Samples of cells treated with synthesized compounds were analyzed on flowcytometry system. Mass spectra were obtained with a spectrometer at 70 eV and working temperature 200 °C. High-resolution mass spectra (HRMS) were measured on a instrument using a time-of-flight mass analyzer (TOF) with an electrospray ionization (ESI). In experiments on selective collisional activation activation energy was set at maximum abundance of fragment peaks. A syringe injection was used for solutions in MeCN-H₂O, 50/50 vol % (flow rate 3 mL/min). Nitrogen was applied as a dry gas; interface temperature was set at 180 °C. IR spectra were recorded on spectrometer as liquid films and are reported in wavenumbers (cm⁻¹). All solvents were dried and freshly distilled before use. Cycloaddition reactions were carried out under a dry argon atmosphere. COT, all the 1,2-bis(diphenylphosphino)ethane, terminal alkynes. alkynols. $Co(acac)_{2}$ CoI_2 , mchloroperbenzoic acid (70-75%, balance 3-chlorobenzoic acid and water) were purchased from commercial sources and used without further purification. Ethynyl(trimethyl)silane,

trimethyl(1,7-octadiynyl)silane, 3-butynyl acetate were prepared according to literature procedures.¹²

Cycloaddition of 1,3,5,7-cyclooctatetraene and alkynes (general procedure). Zn powder (30 mol %) was added to a solution of $Co(acac)_2$ (10 mol %) and dppe (10 mol %) in DCE (1.5 mL) in a glass ampoule under a dry argon atmosphere, and the mixture was stirred at room temperature for 2 min. Next, COT (1.2 mmol), the alkyne (1.0 mmol) in DCE (1.5 mL) and dry ZnI₂ (20 mol %) were added successively. The ampoule was sealed and after heating at 60 °C for 20 h, the ampoule was opened and the reaction was stopped by the addition of petroleum ether and stirring in air for 10 min to deactivate the catalyst. After filtration through a short pad of silica, the volatiles were removed under vacuum. Chromatographic purification over SiO₂ (100% petroleum ether as the eluent) afforded the target products **3a–j**, **7**. All analytical data recorded for compounds **3a,b,f,g,h** were in full accord with previously published data.⁵

7-*Phenylbicyclo*[4.2.2]*deca*-2,4,7,9-*tetraene* (**3***a*): Yield 0.155 g (75%), colorless oil. R_f 0.65. ¹H NMR (500 MHz, CDCl₃): δ 7.45 (d, *J* = 7.7 Hz, 2H), 7.36 (t, *J* = 7.6 Hz, 2H), 7.27 (dd, *J* = 12.7 Hz, *J* = 5.3 Hz, 1H), 6.40-6.46 (m, 1H), 6.32-6.38 (m, 1H), 6.10 (d, *J* = 6.3 Hz, 1H), 5.85-5.92 (m, 3H), 5.77 (dd, *J* = 8.7 Hz, *J* = 5.9 Hz, 1H), 3.88 (dd, *J* = 8.5 Hz, *J* = 6.3 Hz, 1H), 3.41 (dt, *J* = 8.7 Hz, *J* = 6.1 Hz, 1H) ppm.¹³C NMR (125 MHz, CDCl₃): δ 141.9, 141.0, 139.8, 135.1, 128.4 (2C), 126.7, 126.5 (2C), 124.8, 124.7, 121.6, 120.5, 119.8, 38.3, 35.5 ppm. Synthesis of 9,10-dibromo-7-phenylbicyclo[4.2.2]deca-2,4,7-triene (4). With vigorous stirring are added dropwise to 7 ml chloroform under argon and -75 °C from two dropping funnels each a solution of cycloadduct **3a** (3 mmol) in chloroform (8 mL) and bromine (3 mmol) in chloroform (8 mL). After that removes the cooling bath and chloroform immediately are removed under reduced pressure. Chromatographic purification over SiO₂ (100% petroleum ether as the eluent) afforded the target product **4**.

9,10-Dibromo-7-phenylbicyclo[4.2.2]deca-2,4,7-triene (4): Yield 0.256 g (70%), colorless oil. $R_f 0.61$. ¹H NMR (500 MHz, CDCl3) δ 7.32-7.40 (m, 5H), 6.24 (dd, J = 5.5 Hz, J = 1.0 Hz, 1H), 5.99-6.08 (m, 2H), 5.77-5.85 (m, 2H), 5.18-5.20 (m, 1H), 5.01 (dd, J = 5.4 Hz, J = 1.6 Hz, 1H), 4.28 (t, J = 7.0 Hz, 1H), 3.65-3.67 (m, 1H) ppm. ¹³C NMR (125 MHz, CDCl3) δ 139.5, 139.1, 132.0, 130.3, 128.7 (2C), 128.5, 126.9, 126.5 (2C), 126.1, 123.1, 52.4, 51.0, 44.5, 43.3 ppm. IR (liquid film): 3024, 3016, 2918, 1602, 1484, 1435, 692, 678 cm⁻¹. HRMS (ESI-TOF) calcd for $C_{16}H_{14}Br_2$ [M + H]⁺ 364.9540, found 364.9538. Anal. Calcd for $C_{16}H_{14}Br_2$: C, 52.49; H, 3.85; Br, 43.65. Found: C, 52.24; H, 3.73; Br, 43.40.

Synthesis of bicyclo[4.3.1]deca-2,4,8-triene-7,10-diols 5,6a-e, 8 (general procedure). At 0 °C, m-CPBA (2.8 mmol) was added to a mixture of cycloadduct 3a-f, 7 (2 mmol) in dichloromethane (46 mL). The mixture was stirred for 3 h at 0 °C and for 12 h at room temperature. Then NaHCO₃ (4 mmol) was added, and after being stirred for 1 h at 0 °C, the mixture was washed with 1 M NaOH (23 mL) and brine (2×10 mL). The aqueous layer was extracted with dichloromethane $(3 \times 15 \text{ mL})$ and the combined organic solutions dried over MgSO₄, filtered, and concentrated. Purification by column chromatography on silica gel (petroleum ether \rightarrow petroleum ether / ethyl acetate 5/1) afforded the target products 5, 6a-e, 8. 1-Phenylbicyclo[4.3.1]deca-2,4,8-triene-7,10-diol (5a): Yield 0.394 g (82%), white needles, m.p. = 188-189 °C. $R_f 0.60$. ¹H NMR (500 MHz, CDCl₃): δ 7.35-7.48 (m, 5H), 6.53 (dd, J = 10.1Hz, J = 5.4 Hz, 1H), 5.88-5.92 (m, 2H), 5.77-5.87 (m, 3H), 4.26 (s, 1H), 4.07 (dd, J = 10.5 Hz, J= 5.3 Hz, 1H), 3.42 (dd, J = 6.2 Hz, J = 1.8 Hz, 1H) ppm. ¹³C NMR (125 MHz, CDCl₃): δ 144.6, 134.0, 131.2, 130.4, 129.2 (2C), 128.0 (2C), 127.7, 125.6, 124.9, 123.6, 73.0, 65.3, 51.9, 47.1 ppm. IR (liquid film): 3400, 3020, 3011, 2951, 2870, 1578, 1495, 1441 cm⁻¹. HRMS (ESI-TOF) calcd for $C_{16}H_{16}O_2$ [M + H]⁺ 241.1228, found 241.1226. Anal. Calcd for $C_{16}H_{16}O_2$: C, 79.97; H, 6.71. Found: C, 79.79; H, 6.67.

1-Butylbicyclo[4.3.1]*deca-2*, 4,8-*triene-7*, 10-*diol* (**5b**): Yield 0.176 g (40%), colorless oil. R_f 0.58. ¹H NMR (400 MHz, CDCl₃): δ 6.12 (dd, J = 10.0 Hz, J = 5.2 Hz, 1H), 5.74-5.81 (m, 2H), 5.60-5.65 (m, 1H), 5.55-5.57 (m, 2H), 4.08-4.11 (m, 2H), 3.27 (d, J = 4.3 Hz, 1H), 1.81-1.88 (m, 1H), 1.36-1.53 (m, 5H), 0.96 (t, J = 7.0 Hz, 3H) ppm. ¹³C NMR (100 MHz, CDCl₃): δ 135.2, 130.6, 130.2, 126.0, 124.7, 123.9, 70.0, 66.5, 47.9, 45.3, 39.0, 25.5, 23.5, 14.1 ppm. IR (liquid film): 3440, 3020, 2956, 2860, 1722, 1427, 1254, 1028 cm⁻¹. HRMS (ESI-TOF) calcd for C₁₄H₂₀O₂ [M + H]⁺ 221.1541, found 221.1539. Anal. Calcd for C₁₄H₂₀O₂: C, 76.33; H, 9.15. Found: C, 76.22; H, 9.10.

6-Butylbicyclo[4.3.1]deca-2,4,8-triene-7,10-diol (**6b**): Yield 0.176 g (40%), colorless oil. R_f 0.48. ¹H NMR (500 MHz, CDCl₃): δ 6.17 (ddd, *J* = 9.8 Hz, *J* = 5.5 Hz, *J* = 1.8 Hz, 1H), 5.935.97 (m, 1H), 5.87 (dd, J = 10.7 Hz, J = 7.0 Hz, 1H), 5.80 (dd, J = 12.3 Hz, J = 6.9 Hz, 1H), 5.49-5.53 (m, 1H), 5.27 (d, J = 12.3 Hz, 1H), 3.99 (s, 1H), 3.71 (s, 1H), 3.28 (dd, J = 9.0 Hz, J = 4.4 Hz, 1H), 2.13-2.19 (m, 1H), 1.51-1.57 (m, 1H), 1.33-1.40 (m, 4H), 0.95 (t, J = 5.6 Hz, 3H) ppm. ¹³C NMR (125 MHz, CDCl₃): δ 136.4, 129.7, 128.0, 126.2, 123.75, 121.5, 70.8, 70.0, 47.8, 44.9, 34.6, 25.5, 23.5, 14.2 ppm. IR (liquid film): 3400, 3025, 2957, 2874, 1719, 1427, 1255, 1030 cm⁻¹. HRMS (ESI-TOF) calcd for C₁₄H₂₀O₂ [M + H]⁺ 221.1541, found 221.1538. Anal. Calcd for C₁₄H₂₀O₂: C, 76.33; H, 9.15. Found: 76.19; H, 9.11.

1-Hexylbicyclo[4.3.1]*deca-2*,4,8-*triene-7*,10-*diol* (5c): Yield 0.203 g (41%), colorless oil. R_f 0.52. ¹H NMR (500 MHz, CDCl₃): δ 6.13 (dd, J = 10.0 Hz, J = 5.2 Hz, 1H), 5.75-5.84 (m, 2H), 5.55-5.66 (m, 2H), 5.38 (dd, J = 9.8 Hz, J = 1.0 Hz, 1H), 4.09-4.13 (m, 2H), 3.28-3.32 (m, 1H), 1.81-1.87 (m, 1H), 1.33-1.50 (m, 9H), 0.92 (t, J = 7.0 Hz, 3H) ppm. ¹³C NMR (125 MHz, CDCl₃): δ 135.2, 130.6, 130.3, 126.0, 124.7, 123.9, 70.1, 66.5, 48.0, 45.3, 39.2, 31.8, 30.1, 23.3, 22.7, 14.1 ppm. IR (liquid film): 3440, 3021, 2957, 2865, 1726, 1427, 1256, 1028 cm⁻¹. HRMS (ESI-TOF) calcd for C₁₆H₂₄O₂ [M + H]⁺ 249.1854, found 249.1850. Anal. Calcd for C₁₆H₂₄O₂: C, 77.38; H, 9.74. Found: C, 77.23; H, 9.68.

6-*Hexylbicyclo*[4.3.1]*deca-2*,4,8-*triene-7*,10-*diol* (6*c*): Yield 0.198 g (40%), colorless oil. R_f 0.46. ¹H NMR (500 MHz, CDCl₃): δ 6.17 (ddd, J = 9.8 Hz, J = 5.5 Hz, J = 1.8 Hz, 1H), 5.94-5.98 (m, 1H), 5.87 (dd, J = 10.7 Hz, J = 6.9 Hz, 1H), 5.80 (dd, J = 12.3 Hz, J = 7.0 Hz, 1H), 5.51-5.54 (m, 1H), 5.26 (d, J = 12.3 Hz, 1H), 4.01 (s, 1H), 3.72 (s, 1H), 3.28 (dd, J = 8.9 Hz, J =4.4 Hz, 1H), 2.13-2.19 (m, 1H), 1.51-1.56 (m, 1H), 1.27-1.37 (m, 8H), 0.91 (t, J = 7.0 Hz, 3H) ppm. ¹³C NMR (125 MHz, CDCl₃): δ 136.5, 129.7, 128.0, 126.2, 123.8, 121.5, 70.9, 70.0, 47.8, 44.9, 34.8, 31.9, 30.1, 23.2, 22.7, 14.1 ppm. Synthesis of tricyclic alcohols 9h-j, 10j (general procedure). At 0 °C, *m*-CPBA (2.8 mmol) was added to a mixture of cycloadduct 3h-j (2 mmol) in chloroform (46 mL). The mixture was stirred for 3 h at 0 °C, 3 h at 40 °C and for 12 h at room temperature. Then NaHCO₃ (4 mmol) was added, and after being stirred for 1 h at 0 °C, the mixture was washed with 1 M NaOH (23 mL) and brine (2 × 10 mL). The aqueous layer was extracted with dichloromethane (3 × 15 mL) and the combined organic solutions dried over MgSO₄, filtered, and concentrated. Purification by column chromatography on silica gel (petroleum ether \rightarrow petroleum ether / ethyl acetate 1/1) afforded the target products 9h-j, 10j.

 4-Oxatricyclo[6.4.1.0^{1,5}]*trideca-6*,9,11-*trien-13-ol* (**9h**): Yield 0.274 g (72%), colorless oil. R_f 0.66. ¹H NMR (500 MHz, CDCl₃): δ 6.16 (ddd, J = 9.8 Hz, J = 4.6 Hz, J = 1.7 Hz, 1H), 5.83-5.92 (m, 2H), 5.75-5.78 (m, 2H), 5.41-5.45 (m, 1H), 4.12-4.17 (m, 1H), 3.86-3.95 (m, 3H), 3.38 (t, J = 6.8 Hz, 1H), 2.63-2.66 (m, 1H), 2.13-2.20 (m, 1H)) ppm. ¹³C NMR (125 MHz, CDCl₃): δ 135.1, 129.4, 128.8, 124.7, 124.3, 122.5, 78.3, 71.0, 68.4, 50.6, 45.5, 38.5 ppm. IR (liquid film): 3493, 3025, 2967, 2853, 1608, 1440, 1391, 1259 cm⁻¹. HRMS (ESI-TOF) calcd for C₁₂H₁₄O₂ [M + H]⁺ 191.1071, found 191.1068. Anal. Calcd for C₁₂H₁₄O₂: C, 75.76; H, 7.42. Found: C, 75.57; H, 7.32.

5-Oxatricyclo[7.4.1.0^{1,6}]*tetradeca-7*,10,12-*trien-14-ol* (**9i**): Yield 0.282 g (69%), white needles, m.p. = 80-81 °C . R_f 0.63. ¹H NMR (500 MHz, CDCl₃): δ 6.08 (ddd, J = 9.8 Hz, J = 5.6 Hz, J = 1.9 Hz, 1H), 6.00 (t, J = 10.0 Hz, 1H), 5.82 (dd, J = 10.7 Hz, J = 7.1 Hz, 1H), 5.69-5.73 (m, 1H), 5.66 (dd, J = 9.7 Hz, J = 4.3 Hz, 1H), 5.09 (d, J = 12.4 Hz, 1H), 3.91 (d, J = 10.7 Hz, 1H), 3.66-3.68 (m, 1H), 3.54 (ddd, J = 12.9 Hz, J = 11.5 Hz, J = 2.9 Hz, 2H), 3.29 (dd, J = 9.1 Hz, J = 4.4 Hz, 1H), 2.36-2.46 (m, 1H), 2.13-2.17 (m, 1H), 1.87-1.94 (m, 1H), 1.53-1.57 (m, 1H) ppm. ¹³C NMR (125 MHz, CDCl₃): δ 137.4, 130.9, 125.5, 124.7, 124.3, 123.4, 75.4, 74.9, 68.2, 46.3, 42.0, 35.6, 22.5 ppm. IR (liquid film): 3495, 3028, 2963, 2850, 1608, 1440, 1395, 1259 cm⁻¹. HRMS (ESI-TOF) calcd for C₁₃H₁₆O₂ [M + H]⁺ 205.1228, found 205.1223. Anal. Calcd for C₁₃H₁₆O₂: C, 76.44; H, 7.90. Found: C, 76.23; H, 7.68.

Synthesis of bicyclo[4.3.1]deca-2,4,8-triene-7,10-dions 11a,b,d,e 12b,d (general procedure).

A suspension of 4.3 g CrO₃·2Pyridin in 71.7 ml CH₂Cl₂ was cooled to 0 °C. Then to the suspension was added 1.5 mmol of **5a,b,d,e**, or **6b,d** in 1.4 ml CH₂Cl₂ with vigorous stirring. Stirring was continued for 1 h at 0-20 °C. Then the reaction mixture was filtered. The filtrate is washed with saturated NaHCO₃, dried (MgSO₄), and concentrated under reduced pressure. Purification by column chromatography on silica gel (petroleum ether \rightarrow petroleum ether / ethyl acetate 10/1) afforded the target products **11a,b,d,e, 12b,d**.

1-Phenylbicyclo[*4.3.1*]*deca-2,4,8-triene-7,10-dione* (**11***a*): Yield 0.329 g (93%), colorless oil. R_f 0.47. ¹H NMR (500 MHz, CDCl₃): δ 7.28-7.46 (m, 5H), 7.10 (d, *J* = 10.2 Hz, 1H), 6.84 (d, *J* = 10.1 Hz, 1H), 6.29 (dd, *J* = 11.1 Hz, *J* = 7.8 Hz, 1H), 6.22 (dd, *J* = 10.9 Hz, *J* = 7.9 Hz, 1H), 6.15 (d, *J* = 11.2 Hz, 1H), 5.70 (dd, *J* = 10.9 Hz, *J* = 7.6 Hz, 1H), 4.42 (d, *J* = 7.6 Hz, 1H) ppm. ¹³C NMR (125 MHz, CDCl₃): δ 196.7, 192.6, 146.8, 138.9, 131.0, 130.7, 128.5 (2C), 128.3, 128.2 (2C), 126.9, 126.1, 125.0, 69.6, 61.2 ppm. IR (liquid film): 3026, 3015, 2930, 1671, 1492, 1443

cm⁻¹. HRMS (ESI-TOF) calcd for $C_{16}H_{12}O_2$ [M + H]⁺ 237.0915, found 237.0914. Anal. Calcd for $C_{16}H_{12}O_2$: C, 81.34; H, 5.12. Found: C, 81.08; H, 4.98.

1-Butylbicyclo[*4.3.1*]*deca-2,4,8-triene-7,10-dione* (*11b*): Yield 0.308 g (95%), colorless oil. R_f 0.50. ¹H NMR (500 MHz, CDCl₃): δ 6.74 (d, *J* = 10.0 Hz, 1H), 6.57 (d, *J* = 10.5 Hz, 1H), 6.06-6.17 (m, 2H), 5.63 (d, *J* = 10.5 Hz, 1H), 5.52-5.56 (m, 1H), 4.32 (d, *J* = 7.3 Hz, 1H), 2.37-2.44 (m, 1H), 1.63-1.68 (m, 1H), 1.29-1.39 (m, 2H), 1.09-1.16 (m, 2H), 0.89 (t, *J* = 6.9 Hz, 3H) ppm. ¹³C NMR (125 MHz, CDCl₃): δ 198.6, 193.3, 148.5, 132.1, 130.0, 126.1, 125.8, 124.7, 70.3, 56.1, 35.7, 26.7, 23.1, 13.8 ppm. IR (liquid film): 3025, 2952, 2864, 1725, 1693, 1421, 1249, 1025 cm⁻¹. HRMS (ESI-TOF) calcd for C₁₄H₁₆O₂ [M + H]⁺ 217.1228, found 217.1225. Anal. Calcd for C₁₄H₁₆O₂: C, 77.75; H, 7.46. Found: C, 77.57; H, 7.33.

1-Octylbicyclo[*4.3.1*]*deca-2*, *4*, *8-triene-7*, *10-dione* (*11d*): Yield 0.400 g (98%), colorless oil. R_f 0.45. ¹H NMR (500 MHz, CDCl₃): δ 6.72 (d, *J* = 10.1 Hz, 1H), 6.56 (d, *J* = 10.1 Hz, 1H), 6.05-6.12 (m, 2H), 5.61 (d, *J* = 10.6 Hz, 1H), 5.52-5.56 (m, 1H), 4.32 (d, *J* = 7.3 Hz, 1H), 2.36-2.42 (m, 1H), 1.62-1.68 (m, 1H), 1.26-1.32 (m, 10H), 1.10-1.16 (m, 2H), 0.89 (t, *J* = 6.9 Hz, 3H) ppm. ¹³C NMR (125 MHz, CDCl₃): δ 198.6, 193.3, 148.5, 132.2, 130.0, 126.1, 125.8, 124.7, 70.2, 56.1, 35.9, 31.8, 30.0, 29.3, 29.2, 24.5, 22.6, 14.1 ppm. IR (liquid film): 3025, 2960, 2861, 1728, 1693, 1425, 1249, 1026 cm⁻¹. HRMS (ESI-TOF) calcd for C₁₈H₂₄O₂ [M + H]⁺ 273.1854, found 273.1850. Anal. Calcd for C₁₈H₂₄O₂: C, 79.37; H, 8.88. Found: C, 79.19; H, 8.63.

1-[6-(Trimethylsilyl)-5-hexynyl]bicyclo[4.3.1]*deca-2*,4,8-*triene-7*,10-*dione* (11e): Yield 0.431 g (92%), colorless oil. R_f 0.51. ¹H NMR (500 MHz, CDCl₃): δ 6.73 (d, J = 10.1 Hz, 1H), 6.56 (d, J = 10.1 Hz, 1H), 6.05-6.12 (m, 2H), 5.59-5.62 (m, 1H), 5.52-5.56 (m, 1H), 4.31 (d, J = 7.2 Hz, 1H), 2.35-2.42 (m, 1H), 2.16-2.29 (m, 2H), 1.65-1.73 (m, 1H), 1.46-1.62 (m, 2H), 1.21-1.35 (m, 2H), 0.15 (s, 9H) ppm. ¹³C NMR (125 MHz, CDCl₃): δ 198.4, 193.1, 148.3, 131.9, 130.1, 126.2, 125.8, 124.7, 106.8, 85.0, 70.2, 56.0, 35.2, 28.6, 23.5, 19.5, 0.1 (3C) ppm. IR (liquid film): 3030, 2954, 2862, 2173, 1694, 1430, 1249, 1040 cm⁻¹. HRMS (ESI-TOF) calcd for C₁₉H₂₄O₂Si [M +

H]⁺ 313.1623, found 313.1622. Anal. Calcd for C₁₉H₂₄O₂Si: C, 73.03; H, 7.74. Found: C, 72.91; H, 7.49.

6-Butylbicyclo[*4.3.1*]*deca-2,4,8-triene-7,10-dione* (**12b**): Yield 0.308 g (95%), colorless oil. R_f 0.33. ¹H NMR (500 MHz, CDCl₃): δ 6.82 (dd, *J* = 10.0 Hz, *J* = 5.0 Hz, 1H), 6.51 (d, *J* = 9.8 Hz, 1H), 6.15 (dd, *J* = 10.7 Hz, *J* = 7.5 Hz, 1H), 6.01-6.06 (m, 2H), 5.24 (d, *J* = 11.5 Hz, 1H), 3.97 (dd, *J* = 9.1 Hz, *J* = 4.9 Hz, 1H), 2.14-2.20 (m, 1H), 2.05-2.11 (m, 1H), 1.36-1.44 (m, 2H), 1.16-1.31 (m, 2H), 0.89 (t, *J* = 7.3 Hz, 3H) ppm. ¹³C NMR (125 MHz, CDCl₃): δ 198.6, 194.4, 140.9, 131.8, 130.0, 127.2, 125.5, 123.8, 74.2, 51.7, 29.8, 27.3, 23.5, 14.0 ppm. IR (liquid film): 3024, 2955, 2870, 1710, 1695, 1429, 1253, 1032 cm⁻¹. HRMS (ESI-TOF) calcd for C₁₄H₁₆O₂ [M + H]⁺ 217.1228, found 217.1226. Anal. Calcd for C₁₄H₁₆O₂: C, 77.75; H, 7.46. Found: C, 77.47; H, 7.36.

6-Octylbicyclo[*4.3.1*]*deca-2,4,8-triene-7,10-dione* (**12d**): Yield 0.396 g (97%), colorless oil. R_f 0.40. ¹H NMR (500 MHz, CDCl₃): δ 6.81 (dd, *J* = 10.1 Hz, *J* = 5.0 Hz, 1H), 6.50 (d, *J* = 9.7 Hz, 1H), 6.15 (dd, *J* = 10.7 Hz, *J* = 7.5 Hz, 1H), 6.00-6.05 (m, 2H), 5.23 (d, *J* = 11.5 Hz, 1H), 3.97 (dd, *J* = 9.1 Hz, *J* = 4.9 Hz, 1H), 2.13-2.19 (m, 1H), 2.03-2.09 (m, 1H), 1.22-1.39 (m, 12H), 0.89 (t, *J* = 7.0 Hz, 3H) ppm. ¹³C NMR (125 MHz, CDCl₃): δ 198.6, 194.4, 140.9, 131.9, 130.0, 127.2, 125.5, 123.8, 74.2, 51.7, 31.9, 30.4, 30.0, 29.4, 29.3, 25.1, 22.7, 14.1 ppm. IR (liquid film): 3020, 2955, 2870, 1732, 1688, 1430, 1245, 1026 cm⁻¹. HRMS (ESI-TOF) calcd for C₁₈H₂₄O₂ [M + H]⁺ 273.1854, found 273.1851. Anal. Calcd for C₁₈H₂₄O₂: C, 79.37; H, 8.88. Found: C, 79.10; H, 8.79.

ACKNOWLEDGMENTS

Financial support was received from the Russian Foundation for Basic Research (Grants 15-03-01254, 15-33-20043, 16-33-00379). The structural studies of the synthesized compounds were performed with the use of Collective Usage Centre "Agidel" at the Institute of Petrochemistry and Catalysis of RAS. The biological studies of bicycles were done in the Center for Molecular Design and Drug Bioscreening at the Institute of Petrochemistry and Catalysis of RAS that was created with the financial support of the Russian Science Foundation. HMRS data were recorded in the Department of Structural Studies of Zelinsky Institute of Organic Chemistry, Moscow.
